

PRD — DevPulse

Overview

DevPulse is a web platform featuring a data monitoring dashboard, an interactive trivia quiz with a live leaderboard, and an automated contact system. It solves the problem of scattered community metrics and low user retention by merging platform analytics and gamified user engagement into a single interface.

Problem Statement

Platform administrators and active community members are experiencing a lack of centralized engagement tools. Administrators cannot easily track post and company metrics in one place, while users lack interactive elements to keep them returning to the site, resulting in stagnant community growth and fragmented communication. If left unsolved, administrative efficiency will drop, and user churn will increase due to a lack of community incentives.

Goals

1. Achieve a **95% completion rate** for the contact form email automation loop (both admin and user receipts sent successfully) within the first month.
2. Maintain an average of **2 completed quiz games per registered user** every week to drive repeat visits.
3. Ensure the dashboard data syncs accurately, keeping the error rate of the total companies and posts counts **under 1%**.

Non-Goals

- Developing a mobile application (the platform will be responsive web-only for v1).
- Allowing users to create, edit, or submit their own trivia questions.
- Integrating third-party social media feeds into the posts panel.
- Supporting an offline mode for the quiz game.

Users

- **Platform Administrators:** Need an organized, clear summary of system data (users, posts, companies) to quickly evaluate community health.
- **Registered Community Members:** Want a fun, competitive way to test their skills via trivia, see where they rank against peers, and have a direct line to support.

Key Features

1. **Multi-Panel Administration Dashboard:** A single page containing four distinct sections: Overview (aggregated metrics), Trivia (quiz stats), Users (user list and associated companies with a total company counter), and Posts (analytics on shared content).
2. **Interactive Trivia Game:** A dedicated quiz page where signed-up users can play a trivia game to score points.
3. **Ranked Quiz Leaderboard:** A real-time leaderboard panel displaying the ranks and scores of all signed-up users who have played the quiz.
4. **Automated Contact Us Form:** A contact page that instantly emails the submitted form details to the admin while simultaneously firing an automated acknowledgment email back to the sender.

Success Metrics

- **Daily Active Users (DAU):** Monitoring the volume of unique users visiting the dashboard and quiz pages daily.
- **Quiz Retention Rate:** The percentage of users who play a second quiz game within 48 hours of their first.
- **Email Delivery Latency:** The time it takes for both the admin and sender to receive their respective confirmation emails (targeting under 10 seconds).

Open Questions

- Will the dashboard page be entirely public, or is it restricted solely to users with admin privileges?
- What is the exact scoring logic for the quiz leaderboard (e.g., is it based on high scores, cumulative points, or speed)?
- Are the trivia questions pulled from a local database file, or do we need to integrate an external trivia API?

Timeline

- **Milestone 1:** Database setup for users, leaderboard scores, and contact logs.
- **Milestone 2:** Frontend development of the 4-panel Dashboard layout.
- **Milestone 3:** Implementation of the Quiz engine and real-time Leaderboard logic.
- **Milestone 4:** Backend configuration for the dual-email automated Contact Form.
- **Milestone 5:** End-to-end testing and v1 deployment.
